## RESEARCH IMPACT

---

**Corruption-tolerant Replication.** The CTRL protocol from my FAST '18 paper has been adopted and implemented in TigerBeetle ([Link1](#), [Link2](#)), a financial database, making it resilient to storage corruptions and errors. This work has also influenced systems at Facebook ([Link](#)).

**ErrFS and ErrBench.** ErrFS is a user-level FUSE file system that systematically injects file-system faults. Ideas from ErrFS have been adopted by other popular testing tools. ErrBench is a suite of distributed-storage-system workloads which drives systems to interact with their local storage. Through ErrFS and ErrBench, we have exposed many serious bugs in popular distributed systems such as ZooKeeper, Cassandra, and Kafka.

[Link to Artifacts](#)

**PACE.** PACE is a framework to systematically generate and explore persistent states that can occur in a distributed execution, exposing crash vulnerabilities in distributed storage systems. PACE found 26 serious, real-world bugs in popular systems including ZooKeeper, Redis, etcd, and Kafka. Many bugs found by PACE have been fixed by developers.

[Link to Artifacts](#)

**ALICE.** ALICE is a crash-consistency testing framework that I helped build. ALICE has been adopted by others (including an open-source version). ALICE found several real-world bugs in 12 widely used commercial storage software products, including Google's LevelDB, Git, and SQLite.
